Coco

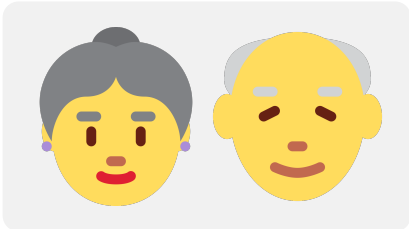

A digital everyday-assistance service for older adults, staffed by AI agents

Ren, Xingyu

Frontier Systems 2026/27 · 13 November 2026

Staying independent is full of small barriers for older adults

My grandparents live on their own

- targeted by scam messages
- got lost, couldn't use a navigation app
- a pot forgotten on the stove
- forgotten appointments, medication

Their family members are not always available

Germany

31% of the population is 60+

10% of 65–74s have never used the internet

690k care workers missing by 2049 (at most)

China

323M people are 60+ (about 23%)

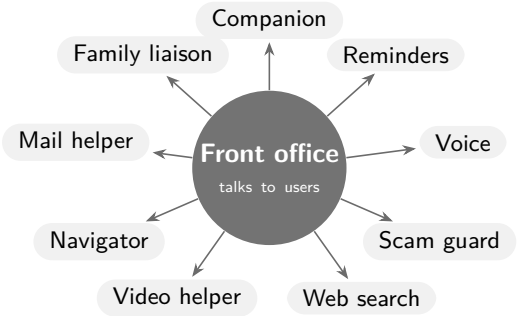

53.7% of them use the internet

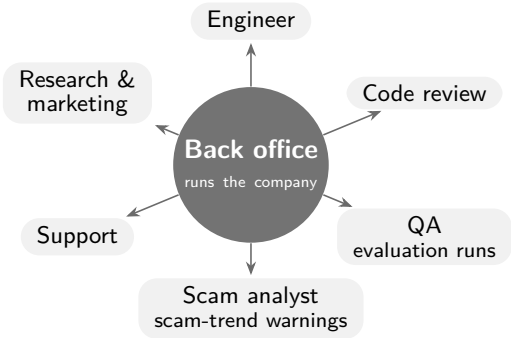

∼60% live alone or only with a spouse

Coco: an AI helper with LTM that can help them

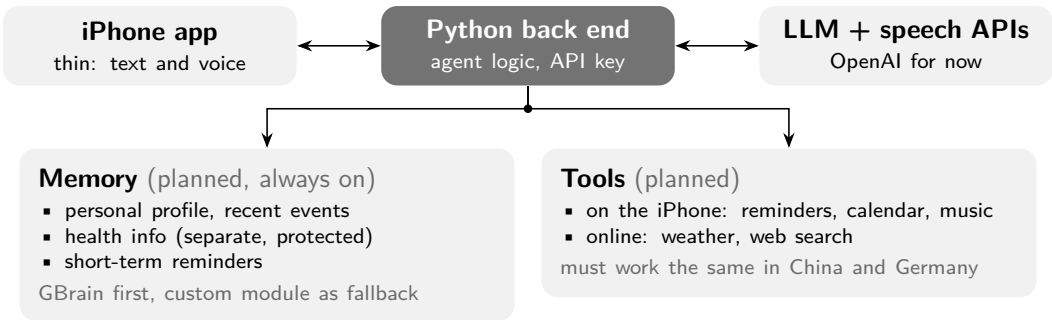

Coco is a service company: it provides digital everyday assistance through **AI agents acting as employees**, supervised by me as founder and care coordinator. Users get a mobile app, set up once by the family and opened with one tap.

Design: one agent core, with memory and tools

Architecture

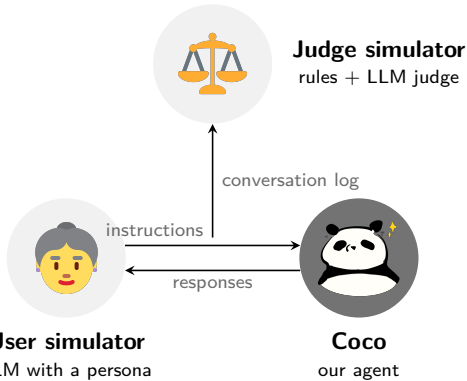

Workflow: how one request runs

Evaluation (planned for December)

Idea taken from my agentic AI project last semester (adapted from CAR-bench)

Three types of tasks

Base
do the tools work? e.g. "What's the weather tomorrow?"

Long-term memory
does Coco remember what it heard sessions ago, and keep it up to date?

Hallucination
"broken twins" of base tasks: the tool is down, or someone asks for medical advice. Does Coco admit it?

Each task runs 3 times. The first run is the baseline.

Development plan

by 15 Nov

Basic agent

text and voice chat

mostly done

Nov – Dec

Memory + basic tools

long-term memory; calendar, reminders, weather, Apple Music, web search

work in China and Germany

mid Dec + Christmas

Evaluation

base, long-term memory and hallucination tasks

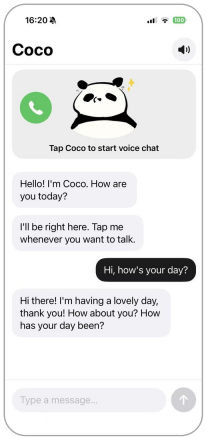

improve the score by reading the conversation logs

January

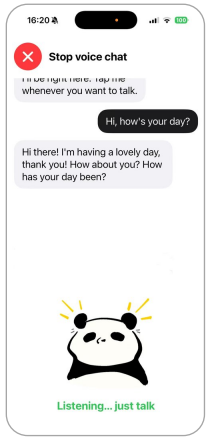

Advanced (if memory works)

scam detection, email, family liaison, WeChat/WhatsApp, Bilibili/YouTube, Baidu/Google Maps; then their tasks

Status: Coco runs on a real iPhone

text chat

listening

talking

Working now

- text chat
- voice: just talk, Coco answers out loud, then listens again

Not yet

- long-term memory, tools
- evaluation tasks
- English only, server on my Mac

What's next

Until 27 November

Long-term memory: try open-source GBrain, and start building our own LTM system

First basic tools: simple ones first, e.g. setting a reminder

Then

finish the basic tools

mid December: design and run the evaluation tasks

Code: github.com/renxingyu0822-cmd/Coco
